

1. A freer horse = A faster and sounder horse.
2. Freer movement of the horse = Less restrictions = Less lameness
3. Separates your horse from the shaft, which will allow the horse complete free movement and will permit you to develop your colt's natural gait.
4. Allows your harness's saddle to stay put, which should eliminate the rubbing or scurving of your horse from the saddle.
5. Keeps your horse's disposition happier, with less pain and no pinching.
6. Do you have a trotter or pacer that has a lot of body movement, causing your sulky to shake and move all over the track? Use the **Swivel Quick Hitch**, which will make your sulky track almost perfectly. This will allow your horse more freedom, permitting your horse to have a faster mile, be more sound and have less lameness.
7. Most important are the comments from the horsemen saying that Protecto's new **Swivel Quick Hitch** helps a sore horse that is on one line to reduce his lameness, thus adding speed to your horse.

## DO THIS IMPORTANT TEST

Stand and watch several horses training and several horses walking to and from the track. Instantly you will notice how the current locked quick-hitch locks to the sulky, forcing the harness saddle to flex back and forth. This movement forces the horse to be restricted in his natural movements. Some horsemen purchase an extra long saddle pad to help protect the horse from rubbing or chafing, but the pad doesn't stop the restriction of your horse's movement.

## NOW SEE THE SWIVEL QUICK HITCH IN ACTION

First note the front part (part B) of the **Swivel Quick Hitch**. This part B stays relatively stationary. The secret now is to look at the horse's harness and the back part (Part A) of the **Swivel Quick Hitch**. The harness is now moving to the natural movement of the horse, because the back part (A) is moving with the natural motion of the horse. The horse's harness and the sulky are now moving together. No more restrictions for your horse.

*After this test, I believe you will agree with the above 7 reasons why you and your horse need Protecto's new **Swivel Quick Hitch***  
**SOME HORSEMEN SAY**

1. I can't see how it works, but I definitely can feel how the **Swivel Quick Hitch** is working before I reach the track.
2. I am able to instantly see improvement with the horse's gait.
3. After I switched to Protecto's new **Swivel Quick Hitch**, my horse has become not only faster, but the horse has less lameness.

Protecto is not able to guarantee these kind of results for all horses,  
 but Protecto knows a horse that is **freer should go faster**.

Protecto's **Swivel Quick Hitch** coupler will replace the current quick-hitch that is connected to your present harness saddle (a simple replacement). Be sure to order your new harness with Protecto's **Swivel Quick Hitch** already installed.
